

South Asia Exact (SAE), with over 20 years of experience supplying high quality pipes and fittings specifically for water supply and soil, waste and ventilation (S.W.V.), is one of the leading brand in Malaysia.

SAE pipes and fittings are manufactured at Tasek Industrial Estate, Perak and Balakong, Selangor respectively. We have 2 distinctive brands namely SA for pipes and EXACT for fittings in order to facilitate the learning of the instrinsic quality of SAE products. Through the years, the company has been actively upgrading its technology and production machineries to achieve its objective of improving efficiency, together with product superiority in order to win total customers' confidence and satisfaction.

SAE products are manufactured with stringent quality control. Our effort to continuously improve on quality and reliability over the vears has been rewarded with the accreditation of ISO 9001 certification. Our products are also certified to the relevant Malaysia and British standards by SIRIM, the Malaysian standards authority. Along with Ikram and SPAN approval. Malaysian local authorities have approved the use of SAE products in projects under their jurisdiction.

SAE has contributed significantly towards national development over the years. The combined experience and resources of 2 major pipes and fittings manufacturers bring to the market warranty for your S.W.V. and pressure system for all your building and construction needs.

COMPANY INTRODUCTION

Early in its history, SAE pipes and fittings were produced under 2 different brands namely SOUTH ASIA for pipes and EXACT for fittings. They were marketed separately by 2 manufacturers from Perak and Selangor respectively in Malaysia.

In early 80s, EXACT had become a leading player in the audio cassette duplication industry. It continued its upstream expansion by investing in plastic injection moulding machinery to produce cassette and Compact Disc (CD) parts and accessories. In 1992, EXACT diversified into manufacturing of uPVC fittings.

SOUTH ASIA, the pipes manufacturer in Perak, focused initially on manufacturing textile fibres, ventured into producing PVC compound before eventually expanded to manufacture uPVC pipes in the early 90s.

Through the years, both manufacturers continued efforts to enhance and optimize its performance to produce PVC pipes and fittings. In 2007, by combining the experience of expertise of both manufacturers, South Asia Exact (SAE) was introduced, now has become one of the nation's leading brand of uPVC complete piping system which is used principally to carry water and wastewater.

Injection machines for manufacturing fittings.

2. Handling stock of uPVC fittings.

3. Extrusion machines for manufacturing pipes.

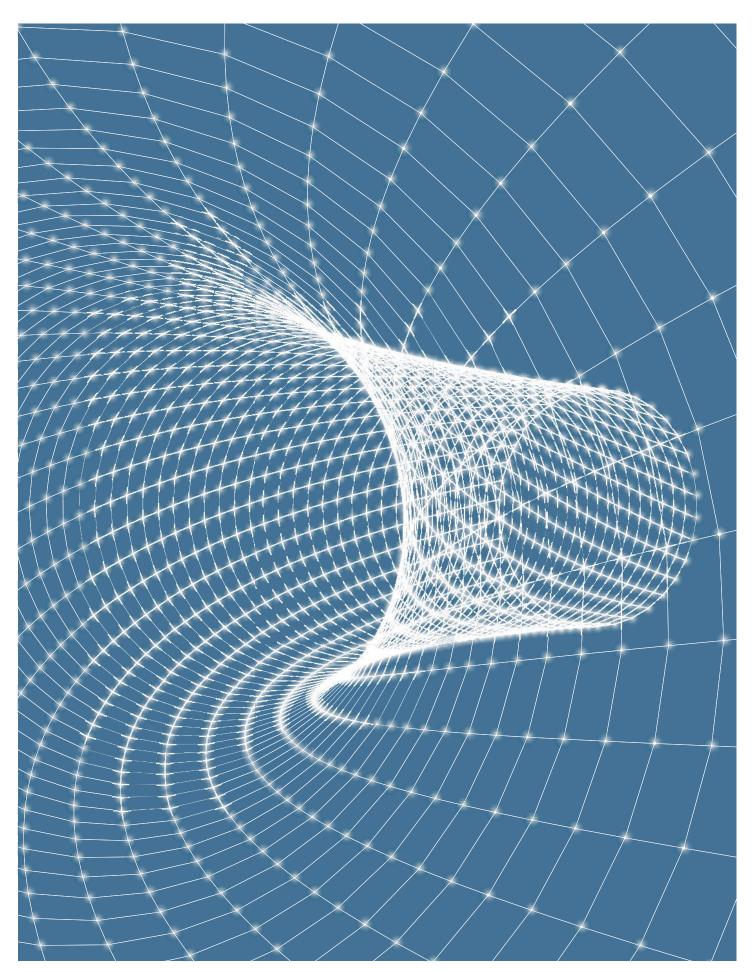

4. Stock checking of uPVC pipes.

5. Measuring dimension of uPVC fittings.

PHYSICAL PROPERTIES

Unplasticised Polyvinyl Chloride (PVC-U) is a thermoplastic material which consists of a PVC resin compounded with varying proportions of stabilizers, lubricants, fillers, pigments, and processing aids. A specific formulation of these ingredients is used to obtain desired properties for S.W.V. system in order to meet the requirements of a wide variety of applications and conditions.

Corrosion resistance - Sanitary drains generate significant volumes of Hydrogen Sulphide gas from bacterial action, which results in the generation of dilute Sulphuric and sulphurous acids especially in turbulent areas. PVC-u has excellent resistance to Sulphuric Acid.

Weather Resistance - SWV pipes and fittings provided long term UV protection when installed above ground.

Handling / Installation - The ease of handling, installation and transport provide overall project savings.

Flexibility - There is flexibility to cope with water & soil movements, subsidence and expansive clays.

Superior flow characteristics – Their very smooth bore and chemical resistance characteristics ensure no scale or built up corrosion, thus producing a high flow capacity.

Easily Machined / Cut - It can be cut and machined with simple tools, ready for joints anywhere on the pipe barrel.

Chemical Resistance - PVC-u pipe has excellent resistance to a wide range of chemicals at ambient temperatures. PVC should not be used with aldehydes, ethers, aromatics, chlorinated hydrocarbons, ketones, benzene, mixtures or similar solvents.

1) GENERAL CHARACTERISTICS

| | Units | Value |
|--|---------|-----------------------|
| Physical | | |
| Coefficient of linear expansion | K-1 | 7x 10 ⁻⁵ |
| Density | Kg/m² | 1.4x 10 ³ |
| Flammability (Oxigen index) | % | 45 |
| Shore hardness | | 80 |
| Softening point (Vicat - minimum) | °C | Fitting - 76 |
| | | Pipe - 79 |
| Specific heat | J(kg.K) | 1.0 x 10 ³ |
| Thermal conductivity | W/(m.K) | 0.14 |
| Mechanical | | |
| Elastic Modulus (long term - 50 years) | MPa | 2800 |
| Elastic Modulus (short term - 100 seconds) | MPa | 1400 |
| Elongation at break | % | Fitting - 75 |
| | % | Pipe - min 80 |
| Poisson's Ratio | | 0.4 |
| Tensile strength (50 year - extrapolated) | MPa | 26 |
| Tensile strength (minimum) | MPa | Fitting - 48 |
| | MPa | Pipe - min 45 |
| Friction Factors | | |
| Manning | | 0.008 - 0.009 |
| Hazen Williams | | 150 |
| Nikuradse roughness | mm | 0.003 - 0.015 |

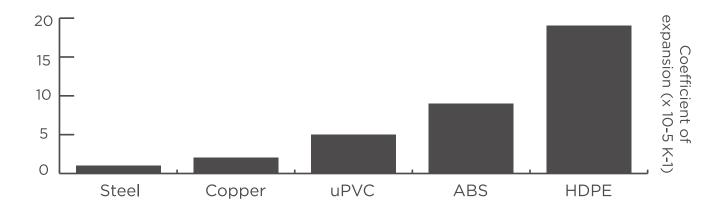

2) THERMAL CHARACTERISTICS

All Thermoplastic materials exhibit a relatively high tendency to expand and contract when subjected to a temperature change.
Accordingly, the design and installation of plastic piping often requires that special attention be paid to this characteristic.

However, SAE uPVC system has a relatively low rate of thermal expansion compare to other plastic materials. Moreover, the thermal reaction thrust in uPVC piping is generally of much lower magnitude than that which is generated in metal piping systems for the same temperature differential.

Likewise, uPVC piping can more easily deform laterally due to the significantly lower elastic modulus of uPVC materials. The movement caused by thermal reaction of the system requires special consideration and, therefore, adequate provision for expansion should be made. Where the system passes through walls or solid floors, sleeves should be provided. Generally, the maximum working temperature of SAE uPVC S.W.V. system when subjected to continuous flow is 70°C.

Thermal Expansion

3) CHEMICAL RESISTANCE

All Thermoplastic materials exhibit a relatively high tendency to expand and contract when subjected to a temperature change.
Accordingly, the design and installation of plastic piping often requires that special attention be paid to this

characteristic.

However, SAE uPVC system has a relatively low rate of thermal expansion compare to other plastic materials. Moreover, the thermal reaction thrust in uPVC piping is generally of much lower

magnitude than that which is generated in metal piping systems for the same temperature differential. Likewise, uPVC piping can more easily deform laterally due to the significantly lower elastic modulus of uPVC materials.

| Chemical Type | PVC Reaction/Suitability |
|---|---|
| Acids | No attack by concentrated or diluted acids at temperature up to 60°C, except for axidizing acids such as concentrated nitric which attacks PVC above 20°C. In stressed applications, design stress, at 20°C, should be reduced by: from 2.5°C for 10% sulphuric - to 27.5% for concentrated nitric. |
| Alkalis | No attack at temperatures up to 60°C even by concentrated alkalis. However in stressed applications, design stress must be reduced significantly, e.g. by 40 - 50% for 10% sodium hydroxide. |
| Aromatic hydrocarbons and highly polar organic materials such as ketones, esters, cyclic ethers, nito - compounds and hydrocarbons. | Not suitable. |
| Aliphatic hydrocarbons | No effect. |
| Aliphatic alcohols | No attack at room temperature but design stress must be reduced by half. |
| Halogens - chlorine | No attack if dry, but not suitable if moist. |
| Halogens - bromine | Not suitable. |
| Halogens - flourine | Not suitable. |
| Halogens - iodine | Not suitable. |
| Oxidizing agents | Little attack even by the strongest, such as concentrated potassium permanganate, but design stress must be reduced by 25%. |
| Reducing agents | No effect up to 60°C. |
| Detergents | No attack. |

NOTE: Even though indicated as acceptable with certain temperature limitations, the use of SAE uPVC S.W.V. system with liquid hydrocarbons such as gasoline and jet fuels should be limited to short-term exposure such as secondary containment systems. The system is not recommended by us for long term exposure to liquid hydrocarbons.

QUALITY CONTROL PROCEDURES

These quality control procedures normally include:

- Raw materials, PVC compound, processing parameters in terms of temperature, pressure and energy input.
- Visual inspection and dimension of diameter, wall thickness and length.
- Production tests carried out of one sample every 8 hours :
 - a) Impact Tests to check the general toughness of the pipe and its ability to withstand the normal shocks which may be expected in handling, transportation and installation during normal use.
 - b) Longitudinal Reversion Tests designed to show up any excessive built-in (residual) stresses in the pipes and fittings.
 - c) Tensile strength to determine the strength over elongation characteristics of pipe material when applied tension is forced to the sample pieces.
 - d) Acetone Test to check the adequacy of the PVC gelation of extruded pipes.
 - e) Short Term Hydrostatic to check the strength of the pipes during internal pressure is applied to the sample pipes.

INSTALLATION CONSIDERATION

Soil, Waste and Ventilation (S.W.V.) system should comprise the minimum of pipe work necessary to carry away the discharges from sanitary appliances in the building quickly, quietly and with freedom from nuisance or risk of injury to health. It is essential that air from the system be prevented from entering the building.

1) POSITIONING AND FIXING

Branch pipes should be fixed with uniform and adequate gradients according to design of the fittings to drain the pipe efficiently. SAE uPVC S.W.V.

fittings have the minimum gradient of 1¼° for branch discharge pipes.

Proper brackets or bangers

Proper brackets or hangers should be installed at the

spacing given at table below. It is not recommended to exceed the maximum spacing between fixings for pipes as it will lead to failure of the system.

| Nominal | Maximum spacing of supports (m) | | | | |
|-----------|---------------------------------|--------------|--|--|--|
| Size (mm) | Vertical pipes | Graded pipes | | | |
| 36 - 56 | 2 | 1 | | | |
| 82 - 200 | 2.5 | 1.2 | | | |

While fixing the system, it is important to follow to the guidelines below:

- a) Securely attach to the structure of the building and not to any other service (i.e. air conditioner support bracket).
- b) Although SAE uPVC S.W.V system is immune to electrochemical reactions caused by acids, bases, and salts that cause corrosion in metals, it is recommended to protect the system when it is exposed to a corrosive environment.
- c) Clamped securely to restrict lateral movement, but to allow thermal movement.
- d) Brackets or hangers should be designed in such a way that minimal load of the system is taken by the joints.

2) JOINTING

The jointing of SAE uPVC S.W.V. system is done by applying solvent cement on both pipes and fittings. It is important to take note of the manufacturer's instructions before application. The solvent cement jointing

procedure with diagram can be found at the following page. Once the installation is done, it is recommended to remove excess cement that left on exposed joints. It is because the softening effect of excess

solvent could permanently distort or weaken the system. Different jointing method is available for pipes and fittings of dissimilar materials.

| Material | Jointing method |
|-----------------------|--|
| Cast and ductile iron | Bolted Gland Rubber ring Adapter with solvent cement on uPVC pipe and epoxy resin on iron pipe |
| Copper and brass | uPVC threaded adapter with solvent cement at uPVC pipe and screwed to copper or brass adapter then silver brazed at copper or brass pipe. Rubber ring |
| Galvanised Steel | uPVC Threaded adapter with solvent cement on uPVC pipe and screwed to threaded galvanised steel pipe. Adapter with solvent cement on uPVC pipe and epoxy resin on galvanised steel pipe |
| Polypropylene | Rubber ring Threaded adapter with solvent cement on uPVC pipe and screwed to proper threaded PP socket. |
| Vitrified Clay | 1. Epoxy resin |

3) INSPECTION AND TESTING

Testing and commissioning should be made during the installation of the S.W.V. system as the work proceeds to ensure that the pipework is properly secured and clear of obstructing rubble and superfluous matter and that all work which is to be concealed is free from defects before it is finally enclosed.

Leak Tests

Detection of leaks can be carried out by smoke test but care is needed not to damage the system by heat or products of combustion. Leakage can also be revealed by soap solution applied to suspect areas.

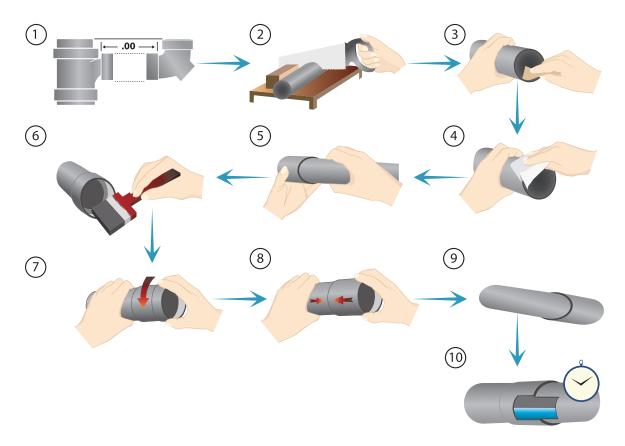

Water flood test is not normally justified but may be applied at the lowest level of the system up to the spill-over level of the lowest sanitary appliance provided the static head does not exceed 6m.

Performance Tests

Upon completion of the system, check generally all sanitary appliances should drain speedily, quietly and completely though the installation. After each test a minimum of 25mm of water seal should be retained in every trap. The maximum loss of seal can be measured by a dip stick or small diameter transparent tube.

The number of appliances, which should be discharged together during the performance test, is given in table below.

WARNING: DO NOT use compressed air or gas to test and SAE uPVC S.W.V. system, and do not use devices propelled by compressed air or gas to clear the system. These practices may result in explosive fragmentation of system piping and components causing bodily injury or death.

INSTALLATION OF PIPES AND FITTINGS WITH SOLVENT CEMENT JOINTING PROCEDURE

- 1. Measure pipe from bottom or shoulder of each socket into which pipe is fit.
- 2. Cut pipe to required length, making sure cut is square.
- 3. Ream inside and chamfer outside of pipe to eliminate all burrs and swarf.
- 4. Sand lightly. Failure to do so lead to failure of the joint. Clean all dirt, moisture, and grease from pipe and fitting socket, using a clean, dry cloth.
- 5. Check dry fit of pipe in fitting socket. Pipe should enter fitting socket to between 1/2 and 3/4 the socket depth.
- 6. Be sure to use only approved types of fittings and adapters. Using brush or dauber-type device, apply a light coat of approved solvent cement to the inside of the fitting socket, using straight, outward strikes.
- 7. Apply solvent cement to the outside of the pipe in a similar manner. Times is important at this stage: apply cement quickly and do not allow it to set before the joint is put together. Always follow safe-handing practices when using solvent cements: use in a well-ventilated area, avoid skin contact (wear gloves) and do not use near heat, sparks or open flame. Immediately insert pipe into fitting socket, giving the pipe a one-quarter turn and making sure it goes all the way to the socket bottom.
- 8. Hold the joint together until a tight sets is attained.
- 9. Check cement bead around joint. A proper joint will normally show a bead around its entire perimeter.
- 10. Any gaps may indicate insufficient cement or the use of light boiled cement on larger diameters where heavy bodied cement was required. After setting, wipe excess cement from the pipe. Don't move the system until the joint have cured(set) at least as long a recommended by the solvent manufacturer.

STORAGE & HANDLING

STORAGE

- 1. Where possible, products should be stored inside their original packaging until ready for use.
- 2. Store in cool dry conditions, preferably under cover so as to avoid damage of any kind; soiling, UV exposure and contamination by oils, petrol or greases.
- 3. Rubber items such as O-rings should be stored in a cool, dry, dark place.
- 4. Store away from excessive heat.
- 5. If stored for an extended period (more than 3 months), should be completely covered with an opaque UV resistant material.
- 6. The storage area must be flat and level, with no sharp objects or projections and able to support the complete plan area and weight of the products being stored.
- 7. Products should be stored in original packaging and stacked not exceeding 3m in height.
- 8. Products of different sizes and shapes should be stacked separately. Where the situation is not possible, larger fittings should be placed at the bottom.

HANDLING AND TRANSPORT

- 1. While uPVC fittings are light and easy to handle, they should not be maltreated. The protection of the sockets is particularly important.
- 2. Products should never be dropped on hard surfaces.
- 3. The dragging of bags full of fittings along the ground is not advisable.
- 4. Products should be transported by a suitable vehicle, having a flat and level load bed with no sharp objects or projections and able to support the complete plan area and weight of the products being transported.

WEWARRANT

1. Dimension Match

Dimension tolerance of pipe and fitting are match together. Leakage problem is no more a worry.

2. Colour Match.

No more headache about different manufacturer with different colour, shades.

3. Better Services

Immediate response to site complains from our group. Product replacement for any manufacturing defect. Your Satisfaction is Our Commitment.(EXACT motto).

4. 5 Year Product Guarantee

Product guarantee free from manufacturing defect and complies with specification.

Remark :

Whilst the information, opinions, advice and recommendation contained have been prepared with proper care, they are offered only in pursuance of the object of providing useful information to assist those interested in technical matter associated with 'S.A.E product'.

The 5 Years Product Guarantee is not intended to be an exhaustive guarantee, as the successful system in each case may depend on numerous factors outside of our control. (eg particular design, site preparation, quality of workmanship etc...)

SAE offer a complete range of soil, waste discharge and ventilation (S.W.V) applications. It was developed in close consultation with the Malaysian plumbing industry.

A full complement of solvent coment jointed pipes and fitting are available from 36, 43 and 56mm for waste water applications. For soil and vent applications, they are available in 82, 110, 160, 200, 250 and 315mm sizes, including transition to 43 and 56mm waste dimensions.

SAE S.W.V. pipes is specified by :

Diameter Application

Nominal size (pipes Diameter)

This is specified by their nominal diameter or size in millimeter, the size range covers from DN 36mm to 315mm (see Dimension section)

1) Application Area Code

All SWV pipes and fitting marked with code "B", "BD" and "D" to indicate the application area for which they are intended as follow:

"B" intended to use above ground inside the building, or for components outside the building fixed into the wall.

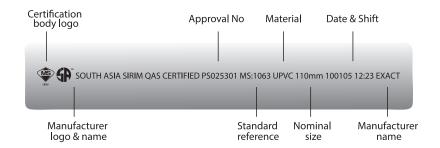

"BD" intended for above ground use for both inside the building, or for components outside the building fixed into the wall and buried inbuilding structures.

"D" for the area under and within 1m from the building where the pipes and fittings are buried in ground and are connected to the underground drainage and sewerage system.

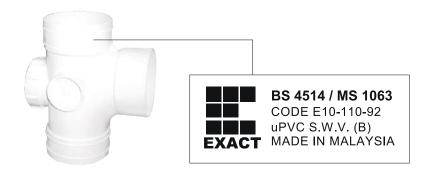

Note: "D" application area is recommended use of Underground Sewerage Pipe (MS 979.1 &MS 979.2 / BS 4660 & BS 5841)as alternative.

2) Marking

All Swv pipes are marked by printer, the follwing details at approximately meter intervals.

The Swv pipes fitting has been clearly and durably marked by moulded impression for each cavity of products.
